# Modulus Operator in C

```
//include is used to add basic C libraries
#include <stdio.h>
//main method is used to run C application
int main(void)
{
    //declaring 2 variables
    int a, b;
    //declare one more variables for store result
    int output;
    //Asking user to enter integer input
    printf("Please enter any 2 integer numbers\n");
    scanf("%d\n%d",&a,&b);
    //Finding the remainder with modulus operator
    output = a % b;
    //displaying output to the end user
    printf("Remainder of %d and %d is = %d", a, b, output);
    return 0;
}
```

```
Please enter any 2 integer numbers
10
3
Remainder of 10 and 3 is = 1
```

## Introduction to Modulus Operator in C

The modulus operator in C is denoted by % (percentile) operator. This modulus operator is used to perform division with remainder. It is used to find the remainder of the division of two operands. This modulus operator works in between 2 operands. The modulus operator finds the division with numerator by denominator which results in the remainder of the

(<https://www.educba.com/software-development/>)

### Start Your Free Software Development Course

Web development, programming languages, Software testing & others

Let's consider a and b are 2 integers then the modulus expression becomes

`a%b`

#### Return value possibilities:

- If a is not completely divisible by b then it produces some non-zero integer value.
- If a is completely divisible by b then the remainder becomes 0(zero).
- If a is some number and b is 0 then we get a compile-time error.

## How does Modulus Operator work in C?

Modulus operator works based on the value received by the end-user. It always finds the remainder of 2 numbers with respect to the numerator.

The below example will illustrate the exact functionality.

- **Example:** `7 % 3` gives us remainder as 1 because when we divide 7 by 3 then we get 2 as quotient and 1 as remainder.
- **Same way:** `8%3` gives us remainder as 2 because when we divide 8 by 3 then we get 2 as quotient and 2 as remainder.

[\(https://www.educba.com/software-development/\)](https://www.educba.com/software-development/)

### Example:

Let  $a=8$  and  $b=3$ , then

- $a \% b \gg a - (a/b) * b$
- $8 \% 3 \gg 8 - (8/3) * 3$
- $8 - (2) * 3$
- $8 - 6$
- $2$

Therefore  $8 \% 3$  is 2.

**Note:** The modulus operator always works with integer numbers only.

## Examples to Implement Modulus Operator in C

Below are the examples mentioned:

### Example #1

Remainder for integer numbers

Code:

```
//include is used to add basic C libraries
#include <stdio.h>

//main method is used to run C application
```

[\(https://www.educba.com/software-development/\)](https://www.educba.com/software-development/)

```
//declare one more variables for store result
int output;
//Asking user to enter integer input
printf("Please enter any 2 integer numbers \n");
scanf("%d\n%d",&a,&b);
//Finding the remainder with modulus operator
output = a % b;
//displaying output to the end user
printf("Remainder of %d and %d is = %d", a,b,output);
return 0;
}
```

Output:

```
Please enter any 2 integer numbers
10
3
Remainder of 10 and 3 is = 1
```

## Example #2

Remainder with float numbers

Code:

```
//include is used to add basic C libraries
#include <stdio.h>
//main method is used to run C application
```

(<https://www.educba.com/software-development/>)

```
//declare one more variables for store result
float output;
//Asking user to enter integer input
printf("Please enter any 2 integer numbers \n");
scanf("%f\n%f",&a,&b);
//Finding the remainder with modulus operator
output = a % b;
//displaying output to the end user
printf("Remainder of %f and %f is = %f", a,b,output);
return 0;
}
```

### Output:

```
main.c: In function 'main':
main.c:17:13: error: invalid operands to binary % (have 'float' and 'float')
  output = a % b;
             ^
```

**Explanation:** As we discussed in this example we are trying to find out the remainder for 2 float numbers result in a compile-time error.

## Example #3

Remainder for numerator float and denominator int

Code:

```
//include is used to add basic C libraries
#include <stdio.h>

//main method is used to run C application
int main(void)
{
    //declaring 2 variables
    float a;
    int b;

    //declare one more variables for store result
    int output;

    //Asking user to enter integer input
```

[\(https://www.educba.com/software-development/\)](https://www.educba.com/software-development/)

```
//displaying output to the end user
printf("Remainder of %f and %d is = %d", a,b,output);
return 0;
}
```

### Output:

```
main.c: In function 'main':
main.c:18:13: error: invalid operands to binary % (have 'float' and 'int')
    output = a % b;
              ^
```

**Explanation:** In this example float numerator with integer denominator will also result in a compile-time error.

## Example #4

Remainder for numerator int and denominator float

### Code:

```
//include is used to add basic C libraries
#include <stdio.h>
//main method is used to run C application
int main(void)
{
    //declaring 2 variables
    int a;
    float b;
    //declare one more variables for store result
```

(<https://www.educba.com/software-development/>)

```
//finding the remainder with modulus operator  
output = a % b;  
//displaying output to the end user  
printf("Remainder of %d and %f is = %d", a,b,output);  
return 0;  
}
```

### Output:

```
main.c: In function 'main':  
main.c:18:13: error: invalid operands to binary % (have 'int' and 'float')  
    output = a % b;  
              ^
```

**Explanation:** In this example int numerator with float denominator will also result in a compile-time error. This concludes both values must be integer type only.

## Example #5

Remainder with zero denominators

### Code:

```
//include is used to add basic C libraries  
#include <stdio.h>  
//main method is used to run C application  
int main(void)  
{  
    //declaring 2 variables  
    int a;
```

(<https://www.educba.com/software-development/>)

```
printf("Please enter any 1 integer number\n"),  
scanf("%d",&a);  
  
//Finding the remainder with modulus operator  
//denominator 0 will result into undefined so we got exception in  
the output  
  
output = a % b;  
  
//displaying output to the end user  
printf("Remainder of %d and %d is = %d", a,b,output);  
  
return 0;  
}
```

Output:

```
Please enter any 1 integer number  
10  
Floating point exception (core dumped)
```

## Conclusion

C modulus operator is used to find the remainder of the 2 numbers. This is always integer only. An important conclusion from the above example is modulus operator is applicable only on integer numbers.
